identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

proliferation of an organism. The antisense nucleic acids are useful for

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are: of the mucleic acid inhibits proliferation of a cell. Also included are: cocding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid, (4) an antibody capable of specifically binding cate polypeptide (5) producing the polypeptide; (6) inhibiting cellular consoliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway creduired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological control pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture computation in which the est compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture computation in which the extent compound; such activity; (11) a culture organism acts; (12) determining the extent compount that inhibits proliferation of the strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable formath), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a

composition, and cited above or fragments between nuclectides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where sequence contained within a Streptococcus nucleic acid sequence.

The first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termin of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, media or ear infection. They are also useful in developing vaccines, immunodominant proteins. The methods are useful for identifying immunodominant proteins. The methods are useful for identifying cimmunodominant proteins. The methods are useful for identifying immunodominant proteins requence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Earddardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                          This invention relates to novel isolated Streptococcus pneumoniae nucleic acid molecules and the antigenic polypeptides encoded by them. The invention may be useful for the production of compounds with an antibacterial activity or for gene therapy. The nucleic acid molecules, compositions and methods disclosed are useful for treating Streptococcus pneumoniae infection. The present sequence is that of an S pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                     The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cold tolerance, heat tolerance, drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan;

c comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant combinant an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. Improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of catbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and continged to the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of 
                                                                                                                                                                                                                                                                                                                                                                                                                       production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2 LAFRACRLKKKAQYEANKVKLWGLNTEYDNLLFVINSIKQEIVNRVQNPRDERGPNMGQK 61

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprising the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of concent, improved plant growth and development under at least one stress providing improved lignin production of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production or improved galactomannan conduction. This sequence represents a bacterial polypeptide used in the printed specification but was obtained in electronic forms from repone to encounty conduction or many conduction and production or the properties of the printed specification but was obtained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynuclectide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

the invention fractive to an isobatcum in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated ontological polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway conclideration, (7) identifying a compound that inhibits proliferation; (8) required for cellular proliferation or the biological pathway or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that compound that inhibits the product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits in which the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for required for proliferation in cells other than S. aureus, S. typhimurium, correction of an organism. The antisense modeled produced acids are useful for the target prokaryotic essential genes. Note: The sequence data for this patent and all act of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the patent of the paten
                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid comprising any one of

RESULT 13

```
the invention trates to a recombinate the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising an improved property comprises transformed plant with the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant with the crompleotide or polypeptide is useful for producing plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by addification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and evelopment of carbohydrates one free scope of the invention. Note: The sequence data for this patent did not form, at the printed specification but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A novel receptor interacting factor (AAW18226) is designated SWRT, i.e. silencing mediator (co-repressor) for retinoic acid receptor (RRK) and thyroid hormone receptor (TR). Its association with RAK and TR both in solution and on DNA response elements is destabilised by ligand. The interaction of SMRT with mutant receptors correlates with the transcriptional silencing activities of receptors. In vivo, SMRT unctions as a potent co-repressor. A GAL4 DNA binding domain fusion of SMRT behaves as a frank repressor of a GAL4-dependent reporter. These data identify a novel class of cofactor which is believed to repersent an important mediator of hormone action. Full-length cDNA for SMRT has been isolated from a HeLa library in a two-hybrid screen using a GAL4 DNA binding domain/RXR fusion protein as bait
                                                                                                                                                                                                        for retinoic acid and thyroid hormone receptor; SMRT;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1333. .1376

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wood WI;

The invention relates to an isolated SWRTe nucleic acid molecule. The nucleic acids are useful in gene therapy, as hybridisation probes for identifying SWRTe-encoding nucleic acid molecules and as primers for amplifying of SWRTe nucleic acid molecules and as primers for simunogens to raise anti-SWRTe antibodies. The polypeptides are useful as immunogens to raise anti-SWRTe antibodies. The SWRTe molecules are useful as targets for discovering and developing modulating agents to predictive medicine, in therapeutic or prophylactic treatment, in chromosome mapping, tissue typing and in forensic identification of a biological sample. Modulators of SWRTe are useful for treating or preventing a condition associated with aberrant SWRTe protein or nucleic acid expression or activity, such as cancer. The present sequence represents the amino acid sequence of the human nuclear receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New SMRTe proteins and nucleic acids, useful in gene therapy, predictive medicine, therapeutic or prophylactic treatment, chromosome mapping, tissue typing and in forensic biology.
                                                                                                                   166. 206

Patent No. 6699703
GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al.
ITILE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus
TITLE OF INVENTION: Pneumoniae for Diagnostics and Therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -----PESLGVPTAQEAS-----VLRGTALGSVPG 183

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Superfamily: H(+)-transporting ATP synthase; H+-transporting ATP synthase alpha chain

Superfamily: H(+)-transporting ATP synthase; H+-transporting ATP synthesis; hydrolase; membrane-associated complex; mitochondrion; nud

Stall/Domain: transit peptide (mitochondrion) #status predicted <TNP-

1/32-505/Product: H+-transporting ATP synthase beta chain #status predicted <MAT>

1/183-190/Region: nucleotide-binding motif A (P-loop)

1/209-384/Domain: H+-transporting ATP synthase alpha chain homology <ATP>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A;Status: preliminary; translated from GB/EMBL/DDBJ

"Prediction of the coding sequences of mouse homologues of KIAA gene:
"Prediction of the coding sequences of 500 mouse KIAA-homologous
orn's incomplete nucleotide sequences of 500 mouse KIAA-homologous
orn's incomplete nucleotide sequences of 500 mouse KIAA-homologous
orn's connainal sequences of cDNA clones
orn's connainal sequences of cDNA clones
orn's connainal 1 c2 domain.

I. SIMILARITY: Concainal 1 c2 domain.
